

**ABSTRACT**

A carrier for elongate, cylindrical chalk sticks comprises a body of flexible material having opposite ends, opposite sides, and inner and outer surfaces. Chalk stick pockets extend into the body from the inner surface toward the outer surface in four rows spaced apart in the direction between the opposite sides and each row includes 50 pockets spaced apart in the direction between the opposite ends. The pockets are elongated in the direction between the opposite sides of the body, and said body is rollable in the direction between the opposite ends to form a roll enclosing said pockets and which roll can be releasably held in the rolled condition by suitable fasteners.
